Additional File 3. Pemetrexed decreases the antiviral activity of the TFV/FTC/DTG combo.

Activated PBMCs were infected with HIV\textsubscript{Bal} and cultured in the presence of the indicated drugs for 10 days. On day 10, virus production was measured by p24 ELISA. Data (mean ± S.D.) are from one donor and are representative of 2 experiments with 2 different donors. Note the logarithmic scale in the Y axis. Undetectable samples were assigned to an arbitrary value of 6 pg/ml, which is the limit of detection of the assay. LOD = limit of detection.
